**ABSTRACT OF THE DISCLOSURE**

10            A blank expansion card adjusts to selected widths within an information  
handling system expansion card bay having horizontally aligned connectors in order  
to provide support to an adjacent expansion card. The blank expansion card has a  
base that couples with an expansion card connector, a body extending from the base  
along a side wall of the expansion card bay, and an adjustable member that extends  
15    from the body an adjustable distance to engage the adjacent expansion card and  
ensure that the expansion card remains in position against an opposing side wall of the  
expansion card bay. The adjustable member essentially adjusts the width of the  
expansion card bay to snugly fit expansion cards of varying width by extending from  
or retracting into a housing of the expansion card blank body.
